

ward, until it reached  $41^{\circ}$  on the 21st May in lat.  $42^{\circ} 10' N.$ , long.  $63^{\circ} 39' W.$  From this position the change was more rapid, as at 7 A.M. on the 22nd, in lat.  $41^{\circ} 19' N.$ , long.  $63^{\circ} 11' W.$ , the temperature at the surface was  $57^{\circ} \cdot 5$ . It is remarkable that although the ship remained stationary the whole of that day, sounding and dredging, and although no current whatever could be detected whilst so employed, yet the temperature at the surface increased from  $57^{\circ} \cdot 5$  at 7 A.M. to  $62^{\circ} \cdot 5$  at 4 P.M. It is true that the sky was clear, and that the power of the sun was therefore great, still it will be seen, by referring to the meteorological register, that the maximum temperature of the air was  $61^{\circ} \cdot 0$ , or  $1^{\circ} \cdot 5$  below that of the water, although the wind was from the southward.

At 6 P.M. on that day, having completed the observations, the vessel proceeded towards Bermuda, the surface water retaining its temperature of  $62^{\circ} \cdot 5$  until 8 P.M., after which it fell to  $58^{\circ} \cdot 0$ , and at midnight to  $54^{\circ} \cdot 0$ , but at 1 A.M. on the 23rd May it rose again to  $64^{\circ} \cdot 8$ , and at 1.30 A.M. to  $68^{\circ}$ . At 4 A.M. the surface water attained a temperature of  $70^{\circ} \cdot 5$ , which it retained until 9 A.M., when a line of ripple on the water was passed, and the temperature fell to  $66^{\circ} \cdot 5$ . At 10.15 A.M. on the 23rd the ship stopped to sound, remaining stationary until 5 P.M.; during this time the surface water, which was ascertained, by astronomical observation, to be running to the southward (confirmed by having to steam to the northward to keep the line perpendicular), varied in temperature from  $67^{\circ} \cdot 2$  to  $68^{\circ} \cdot 0$ . The position at this time was lat.  $39^{\circ} 44' N.$ , long.  $63^{\circ} 22' W.$ , and the serial temperature sounding placed the isotherms of  $60^{\circ}$ ,  $50^{\circ}$ , and  $40^{\circ}$  at precisely the depths that they occupied at Bermuda, then distant 450 miles, and these depths they steadily retained for the remainder of the section (see Diagram 2).

At 5 P.M. on the 23rd the course was continued towards Bermuda, and the surface temperature was found to vary from  $67^{\circ} \cdot 0$  to  $71^{\circ} \cdot 2$  until 8 A.M. on the 24th, when it rose to  $73^{\circ} \cdot 5$ , and remained steady until 6 P.M. A serial temperature, taken at 4 P.M. in lat.  $38^{\circ} 16' N.$ , long.  $63^{\circ} 17' W.$ , showed that the temperature of  $73^{\circ}$  continued to a depth of 50 fathoms, but that between 50 and 75 fathoms a decrease of  $5^{\circ} \cdot 5$  took place. The current, as ascertained by difference between the position calculated from D.R. and observation between 9.30 A.M. and 4 P.M. was easterly, its rate being  $1\frac{1}{2}$  miles per hour. Unfortunately, the weather on the 24th was unfavourable either for sounding or dredging, so that it was impossible to test the current by mooring a boat.

After 6 P.M. on the 24th the surface temperature again became variable, falling to  $64^{\circ} \cdot 5$  by 8 A.M. on the 25th, and varying between  $64^{\circ} \cdot 5$  and  $69^{\circ} \cdot 5$  until 4 A.M. on the 26th, when it again rose to  $70^{\circ} \cdot 5$  and at 2 P.M. to  $73^{\circ} \cdot 5$ , but the serial temperatures on that day (at Station 53) showed that the warm water was quite superficial, as at 25 fathoms the temperature was  $69^{\circ}$ , and at 50 fathoms  $66^{\circ}$ , whereas on the 24th the temperature of  $73^{\circ}$  was observed at the latter depth.
