

of two largish cylindrical whorls, of which the top is angulated and obliquely truncated, and the extreme tip inserted. *Whorls* 6, of slow increase, feebly angulated, with a sloping shoulder; the last is slightly tumid and elongated, with a slightly constricted base produced into a rather large flattened snout. *Suture* linear, a little impressed. *Mouth* oblong, not patulous, rounded above, where to the right a canal runs out into the labral spine; it is pointed below, where it is prolonged into the longish canal. *Outer lip* well arched, prominent, thin. *Inner lip*—above it is continuous with the outer lip; its course is semicircular; on the body it expands with a thin edge, which in front, near the opening of the canal, rises in a thin lamina, and is then bent over to the right to cover the canal; behind it to the left the pillar is scored with the projecting laminæ of the old canal-ends, which connect themselves with the longitudinal varices. H. 0.42 in. B. 0.2. Penultimate whorl, height 0.06. Mouth, height 0.25 (without the canal 0.11), breadth 0.07.

This little shell is very like a *Typhis*, but its spines are not pervious.
