

that Mr Gwyn Jeffreys, in the words "proceeds from the outer margin," does not by margin signify face; and further only means that the ossicle projects beyond the edge in a general way, not using outer in opposition to *columellar*.

In addition to Mr Smith's careful description, it may be well to record that the teeth of the genus do not seem to differ materially from those of *Rissoa*. It is true that the sketch of them which I made for my own use omits the small outmost or third tooth on either side, but such an oversight is apt to occur in the case of specimens preserved in spirit and not examined with special care.
