- Cinachyra barbata*, Soll.
Thenea delicata, Soll., p. 60.
Pæcillastra schulzii, Soll., p. 79.

It may add to the usefulness of these tables if I now point out those species that appear to me to be particularly characteristic of the regions in which they occur. In the Arctic these are:—*Tetilla geniculata*, *Craniella abyssorum*, *Craniella cranium*, *Thenea muricata*, *Pæcillastra compressa*, and *Pachymatisma normani*; possibly *Dercitus bucklandi* should be transferred from the Lusitanian province to this; it may be a northern form which has extended southwards, as its absence from all regions outside the British area would seem to show; if this should prove to be the case, it would add a highly characteristic species to the Arctic province.
