

so numerous are these shrimps. This may refer to the common eatable shrimp, but what follows appears to include species of *Orchestidae* or other Amphipods, for he says: "In Holsatia vocantur *Burren* / *Dithmarsis Front* / *Belgis Garnelen* / *Garners* / *Garnaten* / *Gallis Sauterdele*, *Cheorette*, *Guernette*, ein *Seegityle* / *Meergeis* *Gesn. f. 127.* *Springfrebæ*. In Sanctonum littore maxima earum copia est, et alibi quoque in littoribus Germaniae et Belgii. Hæ parvæ *Squillæ gibbae* avide expetuntur ab Harengis." He goes on to say that many eminent naturalists had stated that the herring fed on nothing but sea-water, an opinion which Behm had satisfactorily refuted by finding in a herring's stomach forty *Squillæ gibbae* (*Garnel*), and Neueranzius by finding more than sixty, though smaller ones. (These may have been *Hyperina*, see note on Thomas Edward, 1868.) On pages 96–97, under the heading *Squilla minima*, he gives the following, § ix.: "Ex *Squillis parvis* et nomine fere carent. Germ. ein *Springfreblein* / ein kleiner Gernier quibusdam ἐγλώποι [read ἐγχλώποι] a colore subfulvo, coctæ tamen rubescunt, χλωρὸς namque viridem, modo luteum colorem Graecis Significat. Ob exiguitatem Vascones *Civade* quasi Avenam vocant, quas e Garuma copiose extrahunt, et pugillatim devorant, sicut avenam veterinæ. Coci quidam vocant *Brava*, quæ vox itidem Avenam significat, *dividitur* in illam, I, quæ Romæ *Gambarella* dicitur.

" 2. Quæ *Gambaruccio*, estque adeo exigua ut mille vix unam libram æquent. *Squillis affine Animalculum* memorat Schoenfeld, p. LXXIII. piscatoribus infestum, quod ad mare Balticum vulgus nominat Scheffte seu Sprockworm / *squillis minimis* figura respondens, crustaque instar illarū coniectum, vix transversum digitum longum retibus et tendiculis, quibus hamis affiguntur, mire noxiū, quæ magno piscatorum detramento arrodit."

It may be noted that at this date the Crustacea are not included among the Insecta. For *Animal* being divided into *Perfectum*, ἔντομον *sanguine præditum*, and *Imperfectum*, ἔντομον *exsangue*, quod non habet sanguinem proprie sic dictum, sed humorem aliū proportione sanguini respondentem, the subdivision of *Imperfectum Animal* seu *exsangue* is made as follows:—" 1. In *Insectum* ἔντομον, quod corpus incisuris distinctum habeat : 2. In *molle*, quod molli cute coniectum μαλακόδερμα. 3. In *crustaceum*, quod tenui crusta obiectum μαλακόστρακον : 4. In *testaceum*, dura testa obiectum, δοτρακόδερμα " (pages 76–78).

1675. MARTENS, FRIDERICH.

Friderich Martens vom Hamburg Spitzbergische oder Groenländische Reise Beschreibung gethan im Jahr 1671. Aus eigner Erfahrung beschrieben / die dazu erforderte Figuren nach dem Leben selbst abgerissen / (so hierbey in Kupffer zu sehen) und jetzo durch den Druck mitgetheilet. Hamburg. Im Jahr 1675.

The fifth chapter, p. 83, is headed "Von etlichen Schild geschlechtern / so auff Grön landischen / oder Spitsbergischen Reisen gefangen werden." Among these he distinguishes *Krabben* and *Sternfische*. Of the *Krabben* he had met with four kinds, first, the *Meerspinne* as the French call it, next, *rothe Krabben oder Garnellen*, thirdly, *kleine graue Krabben oder Granat*, and fourthly, *die so genandte Wallfischs Lauss*. In describing the two last of these, Martens has the distinction of having been, so far as is known, the first to give anything like a definite description of an Amphipod. For this reason the accounts of his third and fourth species seem worth giving in full, as also for other reasons the account of number two. They read as follows:—

2. *Garnell*. Unter den *Garnellen* die man hier siehet und die man in Spitzbergen findet is kein Unterschied. Spitsbergische aber seynd von Farben auch ungekocht roth / rother wie die von Lübeck gekocht zu uns gebracht werden. Der Kopf ist sonderlich / bestehet von
