

PLATE XIV.

---

Drawn from life by me in Lanzerote, January 25, 1867.

---

*Anthemodes ordinata*, n. sp. (p. 229).

- Fig. 1. The complete corm, in the expanded state. The nectosome (seen from the lateral side) is composed of a small apical pneumatophore and two opposite rows of nectophores. The long tubular trunk of the siphosome is densely covered with prismatic bracts, and bears numerous ordinate and equidistant cormidia, each composed of a siphon, a tentacle, a cyston, and two gonodendra, a male and a female. (Compare Pl. XV. fig. 5.)
- Fig. 2. The nectosome of the same corm, seen from the ventral (or dorsal) side.
- Fig. 3. A single nectophore, dorsal view (from above and outside).
- Fig. 4. A single nectophore, lateral view (from the left side).
