

then amethystine, terminated with blue-green; back mixed amethystine and dull yellow-green; uropygium and upper tail-coverts dull yellow-green with scarcely any iridescence; wing-coverts the same, but tinged with amethystine; quills brown, edged with pale rufous or fulvous; tertiaries like wing-coverts, but without any iridescence; chin and throat pale ruddy fulvous like the forehead; remainder of under plumage ruddy fulvous, with an amethystine tinge on the breast and sides of neck; under tail-coverts pale French grey; under wing-coverts like abdomen, but deeper in shade; middle pair of rectrices pure amethystine, with a dark grey terminal band tinged with amethystine; remaining rectrices with a much broader terminal and pure grey band, the remaining part of each being deeply tinged with amethystine; outer pair with a broad, dark-brown subterminal band also washed with amethystine. Wing 4.75, tail, 3.50, tarsus 0.75, bill from forehead 0.72.

This is a small representative form of *P. leucotis*, from which it chiefly differs by its rufo-fulvous forehead, its pure amethystine rectrices, and its short bill.
