

the slight umbilical depression. Colour sub-hyaline white. Spire conical, short, scalar. Apex consists of two small turbinated smooth embryonic whorls, of which the extreme tip rises in a minute dome. Whorls seven in all, rounded but flattened, and increasing more rapidly in breadth than in height. Suture strongly constricted, almost channelled, very oblique. Mouth round, slightly effuse at the point of the pillar. Inner lip just continuous and no more across the body, slightly reverted on the pillar, where there is behind it a small channel and a slight umbilical depression. H. 0·098 in. B. 0·05. Mouth, height 0·028, breadth 0·028.

The only *Scalaria* which this in the least degree recalls is *Scalaria dianæ*, Hinds, which is, however, utterly different.

8. *Scalaria (Cirsotrema) hellenica*, Forbes.
