

The eight genera represented in the collection may be referred to seven different families, viz., Cumidæ, Vaunthompsoniidæ, Lampropidæ, Leuconidæ, Diastylidæ, Cumelidæ and Campylaspidæ, all of which are also represented in the Northern Ocean. Of the fifteen species contained in the collection, one only, *Diastylis stygia*, has been previously described; all the others I regard as new, although some of them seem to be very nearly related to earlier known species.
