

2. Three designate well-marked subgeneric divisions of the genus *Clio*—

(1) *Creseis*; (2) *Hyalocylix*; (3) *Styliola*.

3. One represents the young state of some *Cavolinia*: *Pleuropus*.

4. Finally, the ten remaining titles may be preserved as synonyms of the three genera—

<i>Balantium,</i>	}	= <i>Clio</i> .	<i>Archonta,</i>	}	= <i>Cavolinia</i> .
<i>Cleodora,</i>			<i>Diacria,</i>		
<i>Cuvieria,</i>	}	= <i>Cuvierina</i> .	<i>Hyalæa,</i>		
<i>Triptera,</i>			<i>Orbignyia,</i>		
			<i>Rheda,</i>		
			<i>Tricla,</i>		

For the distinctive characters of the three genera *Clio*, *Cuvierina*, and *Cavolinia*, I refer to the synoptic table of genera (p. 8).

To the Thecosomata which I have united in this genus several generic titles have been applied, as may be seen from the synonyms.

Besides these generic titles, we have to note a considerable number of specific designations, of which only a very small fraction can be retained as applicable to really existing species of the genus *Clio*.

After abstracting all the so-called forms of *Clio* which are really Gymnosomata (see the first part of this Report),² there remains the following formidable list of specific titles attributed to living species. A certain number of extant species are also
